Project Platform	ServiceNow

Document note

This report is based on the project title provided: Employee-Raise-Issue-Record-Producer-Service-Portal-Integration-Guide. Screenshots from the working ServiceNow instance have been inserted in Section 10 below.

1. Abstract

The Employee Raise Issue application is intended to provide employees with a convenient way to report workplace or service-related issues through a ServiceNow Service Portal. A Record Producer presents a user-friendly form and creates a record in the target issue table. The integration connects the employee-facing portal experience with ServiceNow record management, supporting consistent data capture, tracking, and follow-up by the responsible team. The solution can help reduce email-based or manual issue reporting and provide a centralized record of submitted concerns.

2. Introduction

Organizations need a simple and accessible process for employees to report issues. When requests are handled through informal messages or separate channels, information may be incomplete and tracking can become difficult. ServiceNow provides a platform for creating forms, storing records, managing access, and presenting services through a portal.

This project focuses on using a Record Producer within a Service Portal so employees can submit an issue using a guided form. Submitted information is mapped to fields in a ServiceNow table for further review and handling.

3. Problem Statement

Employees may not have a single, consistent channel to raise issues. Manual reporting can lead to missing details, duplicate submissions, limited visibility, and delays in routing issues to the appropriate team. The project addresses this by providing a centralized portal form that captures required information and creates a trackable ServiceNow record.

4. Objectives

- Provide employees with an accessible portal-based method to raise an issue.
- Capture issue details in a structured Record Producer form.
- Create a record in the configured ServiceNow target table upon submission.
- Improve consistency and completeness of submitted information through required fields and validation.
- Support authorized teams in reviewing and managing submitted issues.
- Provide a foundation for future enhancements such as notifications, assignment, and status tracking.

5. Scope

In scope: Service Portal access, Record Producer form configuration, mapping producer variables to target-table fields, submission testing, and basic record verification.

To verify for your implementation: whether assignment rules, email notifications, approvals, SLA definitions, employee self-service status views, or additional integrations were configured. Include these only if they are part of your actual build.

6. Tools and Technologies

Technology / Component	Purpose
ServiceNow Platform	Application platform for forms, tables, records, and configurati n.
Service Catalog – Record Producer	Creates a user-facing form that can generate a record in a sel cted table.
Service Portal	Employee-facing interface for accessing the issue submission service.
ServiceNow Table (sn_ex_sp_employee_rais	eSsto_risesuteh)e submitted issue record.
Client-side / server-side scripting (if used)	May support validation or field mapping; document only script actually implement

7. System Design and Workflow

The expected high-level flow is:

- Employee opens the Service Portal and locates the Raise an Issue service.
- Employee opens the Record Producer and enters the requested information (requester name, category, subcategory).
- The form validates required inputs before submission.
- On submission, the Record Producer maps its variables to the configured target table (sn_ex_sp_employee_raises_issue) and creates a record.
- The authorized support or responsible team reviews the created record, sets Priority and Assignment Group, and takes action according to the organization's process.

8. Implementation Guide

8.1 Create or verify the issue table

Table label: **Employee raises issue**
Technical table name: **sn_ex_sp_employee_raises_issue**

8.2 Configure the Record Producer

- Opened Service Catalog > Catalog Definitions > Record Producers.
- Created the Record Producer titled "Employee Can Raise their issues here" for employee issue submission.
- Set its name, short description, and target table (sn_ex_sp_employee_raises_issue).
- Created variables: Requester name, Category (Network, Software, Hardware, Access), and Subcategory (VPN, Laptop, Server, Forget Password).
- Set mandatory variables (Short Description) and instructional text for employees.

8.3 Integrate with Service Portal

- Confirmed the Service Portal (dev183722.service-now.com) is active and accessible to employees.
- Published the Raise an Issue tile on the Employee Center homepage, linking to the Record Producer.
- Verified the service title and description are clear to employees.

8.4 Configure record handling

After a record is created (e.g., EMP0001022), the support team updates State, Priority, and Assignment Group on the record form and saves the change, as shown in Section 10 below.

9. Testing and Results

Test ID	Test Scenario	Expected Result	Actual Result
T01	Submit the form with required details	Submission succeeds and a record is created.	A record EMP0001022 is created.
T02	Leave a required field blank	Form prevents submission or shows validation.	Validation message is displayed.
T03	Review the created record in the table	Submitted values appear in the corresponding fields.	Values appear correctly in the fields.
T04	Update Priority and Assignment Group	Record saves with the updated values.	Pass — Priority: High, Assignment Group updated.

10. Screenshots and Evidence

The following screenshots were captured from the working ServiceNow dev instance (dev183722.service-now.com).

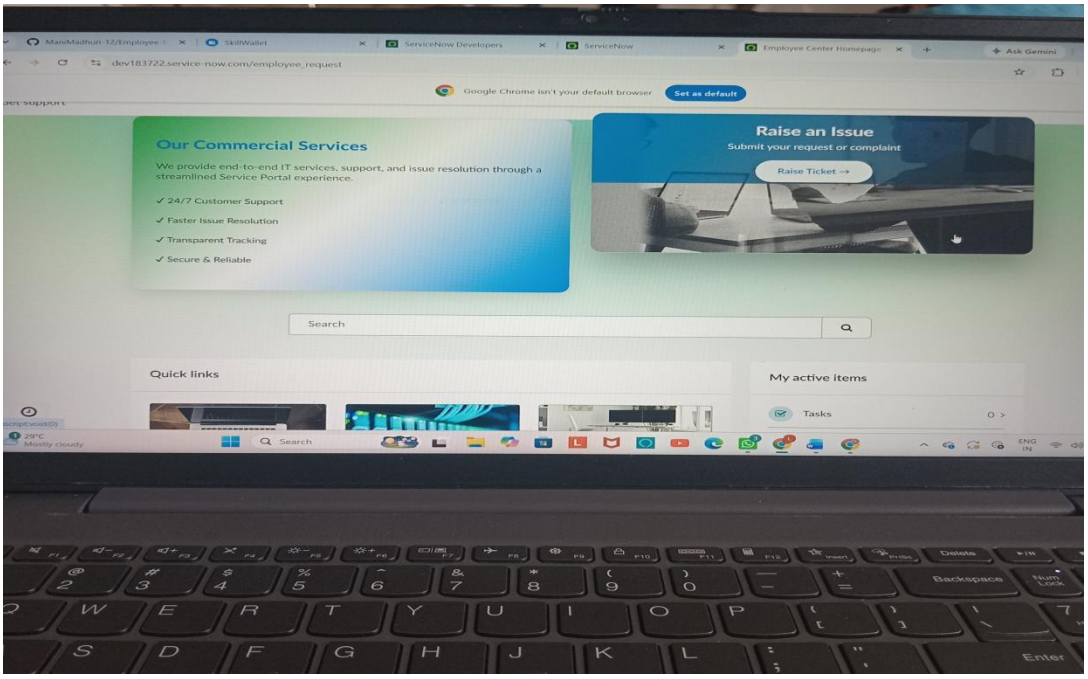

Figure 1 – Employee Center homepage showing the "Raise an Issue" tile used to launch the request.

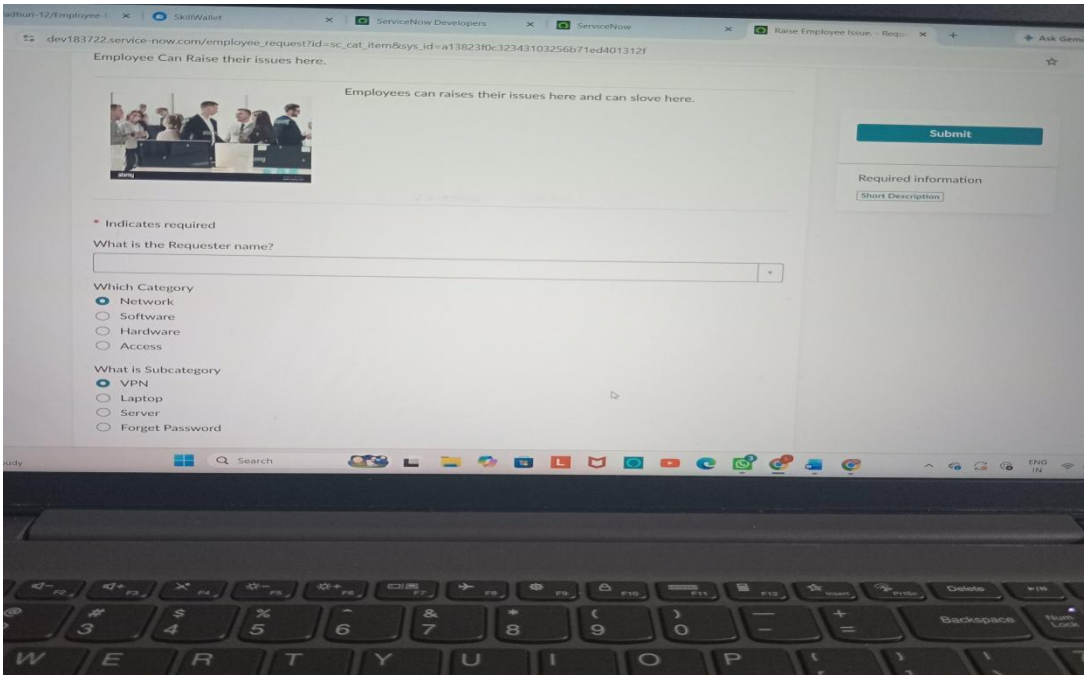

Figure 2 – Record Producer form ("Employee Can Raise their issues here") with Requester name, Category, and Subcategory variables.

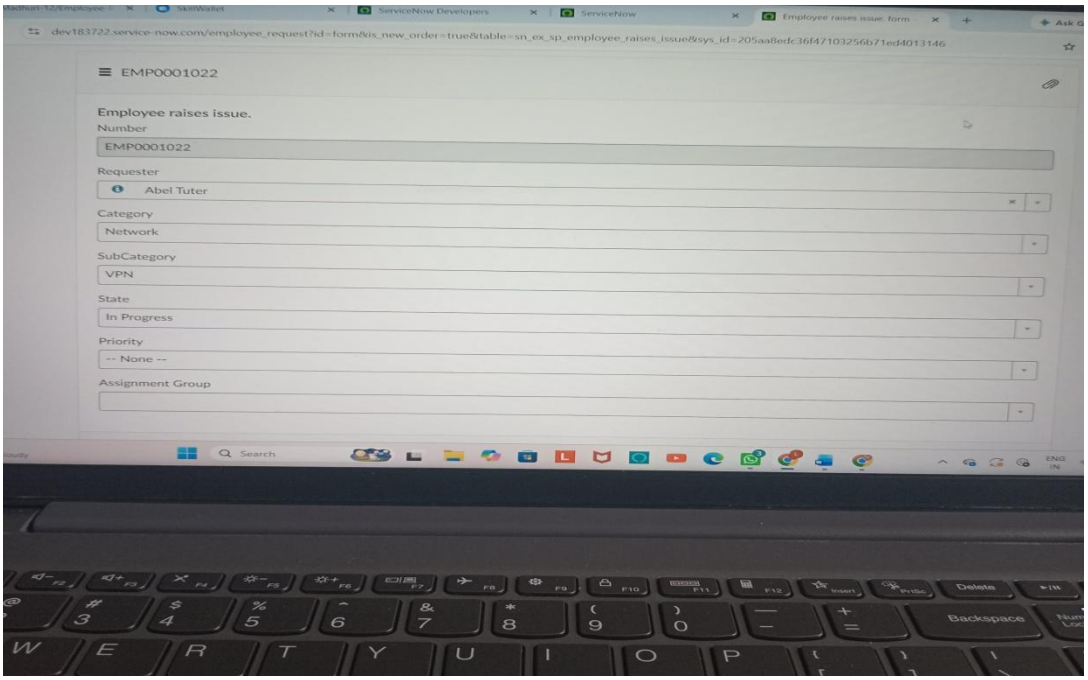

Figure 3 – Created issue record EMP0001022 in the target table, showing Requester, Category, Subcategory, and State.

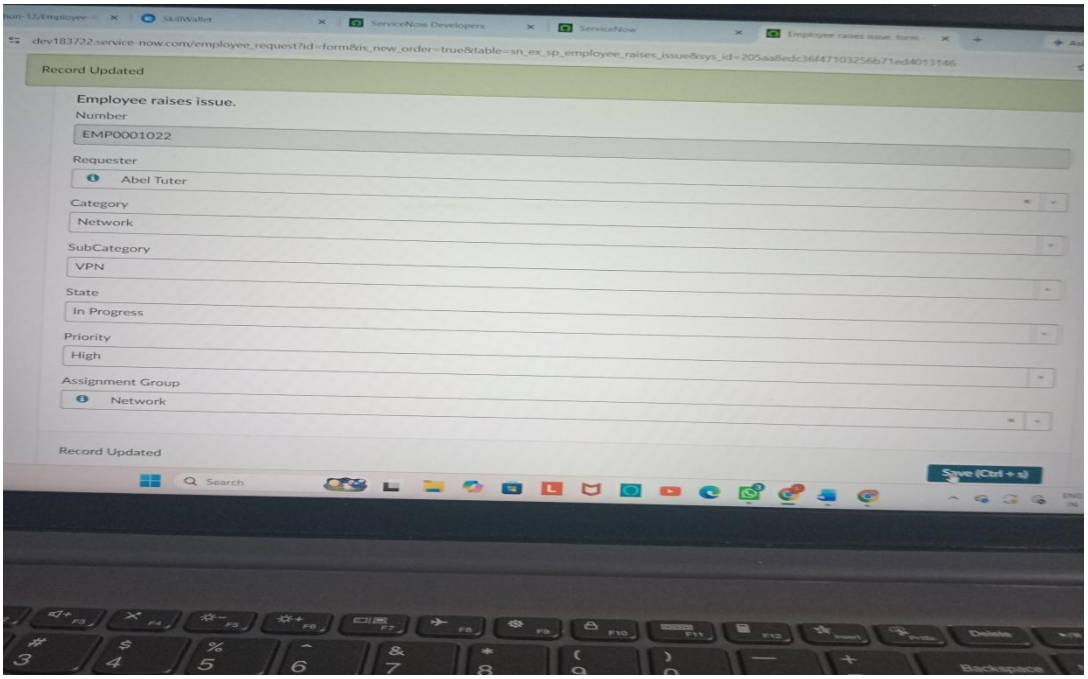

Figure 4 – Record updated by the support team with Priority set to High and Assignment Group set to Network, confirmed by the "Record Updated" message.

11. Security and Data Considerations

- Use role-based access and user criteria appropriate to the intended audience.
- Collect only information necessary to process the issue.

- Do not include passwords, authentication tokens, or sensitive employee data in screenshots or the report.
- Test access and record visibility using appropriate test accounts where permitted.

12. Limitations and Future Enhancements

Potential enhancements include automated assignment, email or in-platform notifications, employee status tracking, dashboards, duplicate detection, and reporting on issue categories and resolution times. These are suggestions for future work and are not claims about the current implementation.

13. Conclusion

The Employee Raise Issue Record Producer and Service Portal integration provides a structured approach for employees to submit issues through a centralized ServiceNow interface. By using a Record Producer to capture information and create a record in a target table, the solution supports more consistent reporting and easier record management, as demonstrated by the test record EMP0001022 created and updated during testing.
